

container feeding

Container Feeder — this machine is one of three models designed to automatically guide and feed glass, metal or plastic containers from manually dumped loads onto a conveyor as single line groups. Model selection depends on container size, case pack counts, number of cases being dumped at a time and production output desired.

A **3 in 1 in-liner** feeds containers into pockets of the main line feed helix. Using individual prime intake helices and multi-pocket starwheels incoming containers are precisely transferred in complete synchronization with the other infeed lines into the main line. 2, 4 in-liners are also available. A new central adjustment feature makes size changes fast and simple.
